GE23131-Programming Using C-2024

Question **2**Correct
Marked out of 5.00

Flag

question

You are designing a poster which prints out numbers with a unique style applied to each of them. The based on the number of closed paths or holes present in a given number.

The number of holes that each of the digits from 0 to 9 have are equal to the number of closed path digit. Their values are:

1, 2, 3, 5, and 7 = 0 holes.

0, 4, 6, and 9 = 1 hole.

8 = 2 holes.

Given a number, you must determine the sum of the number of holes for all of its digits. For example number 819 has 3 holes.

Complete the program, it must must return an integer denoting the total number of holes in num.

Constraints

1 ≤ num ≤ 109

Input Format For Custom Testing

There is one line of text containing a single integer num, the value to process.

Sample Input

630

Sample Output

2

REC-CIS

Add the holes count for each digit, 6, 3 and 0. Return 1 + 0 + 1 = 2.

Sample Case 1

Sample Input

1288

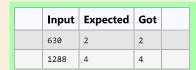

Sample Output

4

Explanation

Add the holes count for each digit, 1, 2, 8, 8. Return 0 + 0 + 2 + 2 = 4.

Answer: (penalty regime: 0 %)

Passed all tests!

Question **3**Correct
Marked out of 7.00

Flag question

The problem solvers have found a new Island for coding and named it as Philaland. These smart peo given a task to make a purchase of items at the Island easier by distributing various coins with differe Manish has come up with a solution that if we make coins category starting from \$1 till the maximum the item present on Island, then we can purchase any item easily. He added the following example to point.

Let's suppose the maximum price of an item is 5\$ then we can make coins of {\$1, \$2, \$3, \$4, \$5}to puitem ranging from \$1 till \$5.

Now Manisha, being a keen observer suggested that we could actually minimize the number of coin and gave following distribution $\{\$1, \$2, \$3\}$. According to him any item can be purchased one time $r\epsilon \$1$ to \$5. Everyone was impressed with both of them. Your task is to help Manisha come up with a m number of denominations for any arbitrary max price in Philaland.

Input Format

REC-CIS

Output Format

Print a single line denoting the minimum number of denominations of coins required.

Constraints

1<=T<=100 1<=N<=5000

Refer the sample output for formatting

Sample Input 1:

10

Sample Output 1:

_

Sample Input 2:

5

Sample Output 2:

3

Explanation:

For test case 1, N=10.

According to Manish {\$1, \$2, \$3,... \$10} must be distributed.

But as per Manisha only {\$1, \$2, \$3, \$4} coins are enough to purchase any item ranging from \$1 to \$ minimum is 4. Likewise denominations could also be {\$1, \$2, \$3, \$5}. Hence answer is still 4.

For test case 2, N=5.

According to Manish {\$1, \$2, \$3, \$4, \$5} must be distributed.

But as per Manisha only {\$1, \$2, \$3} coins are enough to purchase any item ranging from \$1 to \$5. H minimum is 3. Likewise, denominations could also be {\$1, \$2, \$4}. Hence answer is still 3.

Answer: (penalty regime: 0 %)
